

# ECE183DA (Winter 2022)

## Design of Robotic Systems I

Prof. Ankur Mehta (mehtank@ucla.edu)

### Lecture 8 | Reinforcement learning

---

#### Addendum to lecture videos

#### Errata

At the end of lec08b, I describe a modification to the Q-learning algorithm where we have one of the  $Q$  terms in the loss function update a lot slower than the other one. That is, we do gradient descent on  $Q_\theta$  while leaving  $\hat{Q}$  fixed, then every so often update  $\hat{Q} \leftarrow Q_\theta$ . I accidentally swapped which was which in the lecture; the correct assignment of  $Q_\theta$  and  $\hat{Q}$  is what is in the pset, reproduced here:

$$\mathcal{L}(\theta) = \|r + \gamma \max_{a'} \hat{Q}(s', a') - Q_\theta(s, a)\|$$
